

OSUOLALE QUYUM

Automation & AI Integration Engineer | Python - TypeScript - B.Tech Mathematics

Oyo State, Nigeria | kelightsub@gmail.com | koredeve.github.io

linkedin.com/in/osuolale-quyum | github.com/koredeve

PROFESSIONAL SUMMARY

Engineer who builds automation systems that run unattended in production: trading bots executing real on-chain transactions, autonomous content pipelines publishing to multiple platforms on schedule, and Telegram bots with payments, databases, and full button UIs. Mathematics graduate (Second Class Upper) with the analytical foundation for data-heavy and AI-integration work - backtesting engines, LLM-powered generation pipelines, and honest quantitative evaluation of what actually works. Ships fast, tests before shipping, documents everything.

PRODUCTION SYSTEMS (INDEPENDENT PROJECTS, 2025 - 2026)

Solana Trading Bot - TypeScript, grammY, on-chain execution

[private - demo on request](#)

- Telegram bot executing real Solana swaps via Jupiter API: quote, sign, execute, with positions tracked in SQLite and live P&L
- Wallet private key encrypted at rest (AES-256-GCM); on-chain balance reconciliation to prevent stored-state drift from settlement variance
- Real-time token discovery over PumpPortal WebSocket; signal engine cross-references DexScreener market data with Birdeye smart-money wallet activity
- Diagnosed and fixed a silent failure mode where a rate-limited API returned HTTP 200 with an error body, crashing scan cycles invisibly

Autonomous Content Pipeline - Python, Docker, LLM + TTS

[private - demo on request](#)

- End-to-end video generation and publishing: LLM script generation (Groq), TTS voiceover, subtitle rendering, video compositing, scheduled uploads
- Publishes to YouTube (Data API v3) and Instagram Reels (Graph API) across two channels via parameterized dual Docker schedulers
- Telegram control bot for status, stats, and on-demand generation; runs unattended for weeks

Telegram Trading Desk - Python, SQLite

github.com/koredeve/telegram-trading-desk

- Risk-management and trade-journal bot: percent-risk position sizing, R-multiple analytics, expectancy/profit-factor reporting per strategy
- Discipline engine: daily loss caps, oversized-position flags, revenge-trade detection; full inline-button UI

Crypto Scanner, Backtest-First - Python

github.com/koredeve/crypto-momentum-scanner

- Market scanner where every setup must survive a 2-year backtest (conservative fills, fees, gap handling) before it may send a live alert
- Same code path runs backtest and live scanner - what was tested is exactly what runs; negative results documented, failed setups shipped disabled

MetaTrader 4 Expert Advisor - MQL4

[available on request](#)

- XAUUSD trading EA with ATR-based stops, percent-equity risk sizing, daily-loss circuit breakers, and news blackout windows
- Validated via an independent Python backtest replicating the EA logic bar-for-bar over 60 days of 5-minute data

EARLIER FRONT-END WORK (2024 - 2025)

SignalAI (signalai-kappa.vercel.app) - LLM-routed candlestick chart analysis tool with model-switching UI. PennyDash (pennydash.vercel.app) - responsive financial dashboard. Weathering (weather-site-kappa.vercel.app) - real-time weather app. Plus a multi-hospital management platform scaffold (Next.js, Supabase, row-level security).

EXPERIENCE

SQI College of ICT - Industrial Training Intern

2024

- Built responsive web pages and interactive UI features (semantic HTML5, CSS3, vanilla JavaScript)
 - Debugged layout and logic issues across screen sizes; collaborated on group projects and code reviews
-

EDUCATION

Ladoke Akintola University of Technology (LAUTECH)

2021 - 2025

B.Tech. Mathematics, Second Class Upper

TECHNICAL SKILLS

Languages:	Python, TypeScript/JavaScript (ES6+), MQL4, SQL, HTML5/CSS3
Bots & APIs:	Telegram Bot API (python-telegram-bot, grammY), REST, WebSockets, YouTube Data API, Instagram Graph API
Crypto/Trading:	Solana (Jupiter, Birdeye, DexScreener), Binance market data, MetaTrader 4, backtesting engines
AI Integration:	LLM APIs (Groq and OpenAI-compatible), prompt pipelines, TTS (edge-tts), generation workflows
Infrastructure:	Docker, Git/GitHub, SQLite/Postgres, Supabase, Next.js, Vercel, macOS launchd services
