OSUOLALE QUYUM

Software Developer | AI-Powered Applications & Automation

Oyo State, Nigeria · kelightsub@gmail.com
LinkedIn: linkedin.com/in/osuolale-quyum-068209133 · GitHub: github.com/koredeve · Portfolio: koredeve.github.io

PROFESSIONAL SUMMARY

Early-career software developer who turns ideas into practical web applications, automation workflows, and API-integrated tools. I use AI-assisted development to explore and accelerate implementation, while reviewing code, debugging behaviour, and validating what the software actually does.

EDUCATION

B.Sc. Pure & Applied Mathematics, Second Class Upper *2021 – 2025*
Ladoke Akintola University of Technology (LAUTECH) · Ogbomoso, Nigeria

EXPERIENCE

Independent Software Development *2024 – Present*
- Built and iterated on web applications, mathematical utilities, and automation workflows using Python and JavaScript
- Explored milestone-based escrow and grant prototypes with Python GenVM contracts and React interfaces
- Integrated external language-model and API services into experimental interfaces, with clear limits for model-dependent output
- Created a local video-processing workflow with Python, FFmpeg, and the YouTube Data API

SQI College of ICT — Industrial Training Intern *2024*
- Developed responsive web interfaces using semantic HTML5, CSS3, and modern JavaScript
- Applied frontend engineering principles, DOM manipulation techniques, and cross-browser debugging
- Collaborated with peers on technical problem-solving, code reviews, and software project delivery

PROJECTS

ImpactVault Protocol *impact-vault-tau.vercel.app · github.com/koredeve/impact-vault*
- Experimental milestone-gated grant and crowdfunding prototype built with GenLayer contracts and a React interface
- Explores tranche releases and contributor refunds; not presented as a production financial service

WorkProof Protocol *workproof-gamma.vercel.app · github.com/koredeve/workproof*
- Experimental freelance-escrow prototype exploring milestone releases and deliverable evaluation on GenLayer testnet
- Built with Python GenVM contract logic and a React/Vite frontend; open-web evaluation remains exploratory

SignalAI Chart Analysis Engine *signalai-kappa.vercel.app · github.com/koredeve/SignalAi*
- Prototype chart-analysis interface comparing model responses to uploaded financial charts
- Uses external vision-model services; outputs are exploratory and not financial advice

DeltaPerp Arbitrage Terminal *deltaperp.ai.studio*
- Browser-based calculator for estimating cash-and-carry yields from funding, borrow-cost, and spot-price inputs
- Uses deterministic formulas; figures should be independently checked before any trading decision

FORGE Suite (Him & Her) *forgehim.vercel.app · github.com/koredeve/forge-fitness*
- Calisthenics and targeted biomechanics progressive training platforms built on Next.js & React
- Features guided workout players, interactive exercise skill trees, and custom routine builders

YouTube Automation Engine *Python & Automation CLI*
- Local Python workflow for repeatable video rendering and scheduling using FFmpeg and the YouTube Data API

MathSolverBot & Car LandedIQ *mathsolverbot.vercel.app · github.com/koredeve/math-solver*
- Conversational mathematics solver providing step-by-step reasoning via OpenRouter API, Marked.js, and MathJax
- Nigerian customs duty landed cost bidding calculator with real tariff formulas

TECHNICAL SKILLS

Languages: Python, JavaScript, HTML, CSS
Application work: API integration, automation, AI-assisted implementation, GenLayer/GenVM experimentation
Frontend: React, Next.js, Vite, Tailwind CSS
Tools: Git, GitHub, Vercel, FFmpeg, REST APIs
